

DSC 3000 MULTICOUNTER

Data sheet

Combined Counter and Batch Counter.

DSC 3000 Multicounter is a minicomputer, which fitted with a microswitch is used with our scale weighers.

The computer has the following 5 functions:

1. **Real-time clock** shows the present time.
2. **Total counter** sums up the overall number of signals from the microswitch.
3. **Batch counter** stops the auger filling the weigher, when the preset batch has run through the weigher.
4. **Timer** up to 3 different time periods can be set, in which the above mentioned settings can be activated. Also the set batch is reset automatically after 24 hours.
5. **Multiplication factor** automatically regulates the number of signals per preset batch, up or down at the start of the day depending on a set %-factor.

If DSC 3000 is used solely as a counter/batch counter, functions 4 and 5 can be deactivated directly on the keypad.
